Si5367

PRELIMINARY DATA SHEET

µP-PROGRAMMABLE PRECISION CLOCK MULTIPLIER

Description

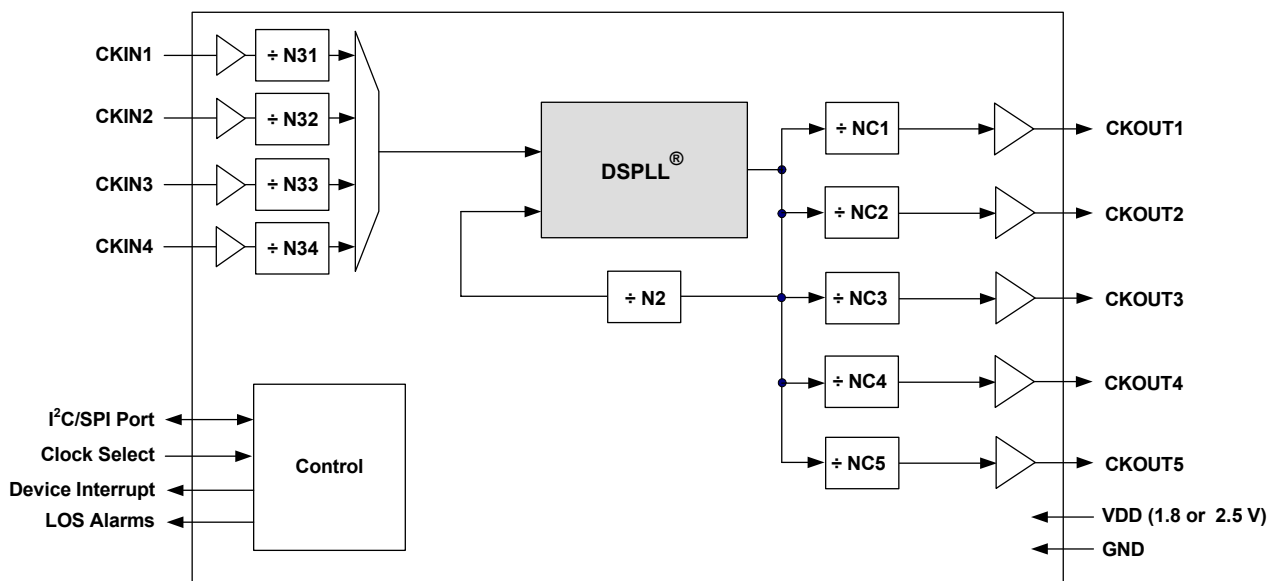

The Si5367 is a low jitter, precision clock multiplier for applications requiring clock multiplication without jitter attenuation. The Si5367 accepts four clock inputs ranging from 10 to 707 MHz and generates five frequency-multiplied clock outputs ranging from 10 to 945 MHz and select frequencies to 1.4 GHz. The device provides virtually any frequency translation combination across this operating range. The outputs are divided down separately from a common source. The Si5367 input clock frequency and clock multiplication ratio are programmable through an I²C or SPI interface. The Si5367 is based on Silicon Laboratories' 3rd-generation DSPLL[®] technology, which provides any-rate frequency synthesis in a highly integrated PLL solution that eliminates the need for external VCXO and loop filter components. The DSPLL loop bandwidth is digitally programmable, providing jitter performance optimization at the application level. Operating from a single 1.8 or 2.5 V supply, the Si5367 is ideal for providing clock multiplication in high performance timing applications.

Applications

- SONET/SDH OC-48/OC-192 line cards
- GbE/10GbE, 1/2/4/8/10GFC line cards
- ITU G.709 and custom FEC line cards
- Wireless basestations
- Data converter clocking
- xDSL
- SONET/SDH + PDH clock synthesis
- Test and measurement

Features

- Generates any frequency from 10 to 945 MHz and select frequencies to 1.4 GHz from an input frequency of 10 to 710 MHz
- Low jitter clock outputs w/jitter generation as low as 0.6 ps rms (50 kHz–80 MHz)
- Integrated loop filter with selectable loop bandwidth (30 kHz to 1.3 MHz)
- Four clock inputs w/manual or automatically controlled hitless switching
- Five clock outputs with selectable signal format (LVPECL, LVDS, CML, CMOS)
- Support for ITU G.709 FEC ratios (255/238, 255/237, 255/236)
- LOS alarm outputs
- Digitally-controlled output phase adjust
- I²C or SPI programmable settings
- On-chip voltage regulator for 1.8 or 2.5 V ±10% operation
- Small size: 14 x 14 mm 100-pin TQFP
- Pb-free, RoHS compliant

Si5367

Si5367

1. Functional Description

The Si5367 is a low jitter, precision clock multiplier for applications requiring clock multiplication without jitter attenuation. The Si5367 accepts four clock inputs ranging from 10 to 707 MHz and generates five frequency-multiplied clock outputs ranging from 10 to 945 MHz and select frequencies to 1.4 GHz. The device provides virtually any frequency translation combination across this operating range. Independent dividers are available for every input clock and output clock, so the Si5367 can accept input clocks at different frequencies and it can generate output clocks at different frequencies. The Si5367 input clock frequency and clock multiplication ratio are programmable through an I²C or SPI interface. Silicon Laboratories offers a PC-based software utility, *DSPLLsim*, that can be used to determine the optimum PLL divider settings for a given input frequency/clock multiplication ratio combination that minimizes phase noise and power consumption. This utility can be downloaded from www.silabs.com/timing.

The Si5367 is based on Silicon Laboratories' 3rd-generation DSPLL[®] technology, which provides any-rate frequency synthesis in a highly integrated PLL solution that eliminates the need for external VCXO and loop filter components. The Si5367 PLL loop bandwidth is digitally programmable and supports a range from 30 kHz to 1.3 MHz. The *DSPLLsim* software utility can be used to calculate valid loop bandwidth settings for a given input clock frequency/clock multiplication ratio.

The Si5367 monitors all input clocks for loss-of-signal and provides a LOS alarm when it detects missing pulses on its inputs.

In the case when the input clocks enter alarm conditions, the PLL will freeze the DCO output frequency near its last value to maintain operation with an internal state close to the last valid operating state.

The Si5367 has five differential clock outputs. The signal format of the clock outputs is programmable to support LVPECL, LVDS, CML, or CMOS loads. If not required, unused clock outputs can be powered down to minimize power consumption. The phase difference between the selected input clock and the output clocks is adjustable in 200 ps increments for system skew control. In addition, the phase of each output clock may be adjusted in relation to the other output clocks. The resolution varies from 800 ps to 2.2 ns depending on the PLL divider settings. Consult the *DSPLLsim* configuration software to determine the phase offset resolution for a given input clock/clock multiplication ratio combination. For system-level debugging, a bypass mode is available which drives the output clock directly from the input clock, bypassing the internal DSPLL. The device is powered by a single 1.8 or 2.5 V supply.

1.1. Further Documentation

Consult the Silicon Laboratories Any-Rate Precision Clock Family Reference Manual (FRM) for more detailed information about the Si5367. The FRM can be downloaded from www.silabs.com/timing.

Silicon Laboratories has developed a PC-based software utility called *DSPLLsim* to simplify device configuration, including frequency planning and loop bandwidth selection. This utility can be downloaded from www.silabs.com/timing.

Si5367

2. Pin Descriptions: Si5367

Table 3. Si5367 Pin Descriptions

Pin #	Pin Name	I/O	Signal Level	Description
1, 2, 4, 17, 20, 22, 23, 24, 25, 37, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 66, 67, 72, 73, 74, 75, 80, 85, 95	NC			No Connect. These pins must be left unconnected for normal operation.
3	RST	I	LVC MOS	External Reset. Active low input that performs external hardware reset of device. Resets all internal logic to a known state and forces the device registers to their default value. Clock outputs are tristated during reset. After rising edge of RST signal, the device will perform an internal self-calibration. This pin has a weak pull-up.

Note: Internal register names are indicated by underlined italics, e.g. *INT_PIN*. See Si5368 Register Map.

29 30	CKIN4+ CKIN4-	I	MULTI	<p>Clock Input 4. Differential clock input. This input can also be driven with a single-ended signal. CKIN4 serves as the frame sync input associated with the CKIN2 clock when <u>CK_CONFIG_REG</u> = 1.</p>										
34 35	CKIN2+ CKIN2-	I	MULTI	<p>Clock Input 2. Differential input clock. This input can also be driven with a single-ended signal.</p>										
<p>Note: Internal register names are indicated by underlined italics, e.g. <u>INT_PIN</u>. See Si5368 Register Map.</p>														

Si5367

Table 3. Si5367 Pin Descriptions (Continued)

Pin #	Pin Name	I/O	Signal Level	Description
39 40	CKIN3+ CKIN3-	I	MULTI	Clock Input 3. Differential clock input. This input can also be driven with a single-ended signal. CKIN3 serves as the frame sync input associated with the CKIN1 clock when <u>CK_CONFIG_REG</u> = 1.
44 45	CKIN1+ CKIN1-	I	MULTI	Clock Input 1. Differential clock input. This input can also be driven with a single-ended signal.
58	C1A	O	LVC MOS	CKIN1 Active Clock Indicator. This pin serves as the CKIN1 active clock indicator. The <u>CK1_ACTV_REG</u> bit always reflects the active clock status for CKIN1. If <u>CK1_ACTV_PIN</u> = 1, this status will also be reflected on the C1A pin with active polarity controlled by the <u>CK_ACTV_POL</u> bit. If <u>CK1_ACTV_PIN</u> = 0, this output tristates.
59	C2A	O	LVC MOS	CKIN2 Active Clock Indicator. This pin serves as the CKIN2 active clock indicator. The <u>CK2_ACTV_REG</u> bit always reflects the active clock status for CKIN_2. If <u>CK2_ACTV_PIN</u> = 1, this status will also be reflected on the C2A pin with active polarity controlled by the <u>CK_ACTV_POL</u> bit. If <u>CK2_ACTV_PIN</u> = 0, this output tristates.
60	SCL	I	LVC MOS	Serial Clock. This pin functions as the serial port clock input for both SPI and I ² C modes. This pin has a weak pull-down.
61	SDA_SDO	I/O	LVC MOS	Serial Data. In I ² C microprocessor control mode (CMODE = 0), this pin functions as the bidirectional serial data port. In SPI microprocessor control mode (CMODE = 1), this pin functions as the serial data output.
68 69	A0 A1	I	LVC MOS	Serial Port Address. In I ² C control mode (CMODE = 0), these pins function as hardware controlled address bits. In SPI control mode (CMODE = 1), these pins are ignored. This pin has a weak pull-down.
70	A2_SS	I	LVC MOS	Serial Port Address/Slave Select. In I ² C microprocessor control mode (CMODE = 0), this pin functions as a hardware controlled address bit. In SPI microprocessor control mode (CMODE = 1), this pin functions as the slave select input. This pin has a weak pull-down.
Note: Internal register names are indicated by underlined italics, e.g. <u>INT_PIN</u> . See Si5368 Register Map.				

Si5367

Table 3. Si5367 Pin Descriptions (Continued)

Pin #	Pin Name	I/O	Signal Level	Description
71	SDI	I	LVC MOS	Serial Data In. In SPI microprocessor control mode (CMODE = 1), this pin functions as the serial data input. In I ² C microprocessor control mode (CMODE = 0), this pin is ignored. This pin has a weak pull-down.
77 78	CKOUT3+ CKOUT3-	O	MULTI	Clock Output 3. Differential clock output. Output signal format is selected by <u>SFOUT3_REG</u> register bits. Output is differential for LVPECL, LVDS, and CML compatible modes. For CMOS format, both output pins drive identical single-ended clock outputs.
82 83	CKOUT1- CKOUT1+	O	MULTI	Clock Output 1. Differential clock output. Output signal format is selected by <u>SFOUT1_REG</u> register bits. Output is differential for LVPECL, LVDS, and CML compatible modes. For CMOS format, both output pins drive identical single-ended clock outputs.
87 88	CKOUT5- CKOUT5+	O	MULTI	Clock Output 5. Differential clock output. Output signal format is selected by <u>SFOUT5_REG</u> register bits. Output is differential for LVPECL, LVDS, and CML compatible modes. For CMOS format, both output pins drive identical single-ended clock outputs.
90	CMODE	I	3-Level	Control Mode. Selects I ² C or SPI control mode for the device. 0 = I ² C Control Mode. 1 = SPI Control Mode.
92 93	CKOUT2+ CKOUT2-	O	MULTI	Clock Output 2. Differential clock output. Output signal format is selected by <u>SFOUT2_REG</u> register bits. Output is differential for LVPECL, LVDS, and CML compatible modes. For CMOS format, both output pins drive identical single-ended clock outputs.
97 98	CKOUT4- CKOUT4+	O	MULTI	Clock Output 4. Differential clock output. Output signal format is selected by <u>SFOUT4_REG</u> register bits. Output is differential for LVPECL, LVDS, and CML compatible modes. For CMOS format, both output pins drive identical single-ended clock outputs.
GND PAD	GND PAD	GND	Supply	Ground Pad. The ground pad must provide a low thermal and electrical impedance to a ground plane.

Note: Internal register names are indicated by underlined italics, e.g. INT_PIN. See Si5368 Register Map.

ddd	—	—	0.08
θ	0°	3.5°	7°

Notes:

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing per ANSI Y14.5M-1994.
3. This package outline conforms to JEDEC MS-026, variant AED-HD.
4. Recommended card reflow profile is per the JEDEC/IPC J-STD-020C specification for Small Body Components.

Si5367

5. Recommended PCB Layout

Figure 5. PCB Land Pattern Diagram

Table 5. PCB Land Pattern Dimensions

Dimension	MIN	MAX
e	0.50 BSC.	
E	15.40 REF.	
D	15.40 REF.	
E2	3.90	4.10
D2	3.90	4.10
GE	13.90	—
GD	13.90	—
X	—	0.30
Y	1.50 REF.	
ZE	—	16.90
ZD	—	16.90
R1	0.15 REF	
R2	—	1.00

Notes (General):

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing is per the ANSI Y14.5M-1994 specification.
3. This Land Pattern Design is based on IPC-7351 guidelines.
4. All dimensions shown are at Maximum Material Condition (MMC). Least Material Condition (LMC) is calculated based on a Fabrication Allowance of 0.05 mm.

Notes (Solder Mask Design):

1. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 µm minimum, all the way around the pad.

Notes (Stencil Design):

1. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
2. The stencil thickness should be 0.125 mm (5 mils).
3. The ratio of stencil aperture to land pad size should be 1:1 for the perimeter pads.
4. A 4 x 4 array of 0.80 mm square openings on 1.05 mm pitch should be used for the center ground pad.

Notes (Card Assembly):

1. A No-Clean, Type-3 solder paste is recommended.
2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020C specification for Small Body Components.

Si5367

DOCUMENT CHANGE LIST

Revision 0.1 to Revision 0.2

- Changed LVTTTL to LVCMOS in Table 2, "Absolute Maximum Ratings," on page 3.
- Updated "2. Pin Descriptions: Si5367".
 - Changed FSOUT (pins 87 and 88) to CLKOUT5.
 - Changed FS_ALIGN (pin 21) control pin to GND.
 - Changed pin 16 to ground.

Revision 0.2 to Revision 0.3

- Removed references to latency control, INC, and DEC pins.
- Updated block diagram on page 1.
- Added Figure 1, "Typical Phase Noise Plot," on page 4.
- Updated "2. Pin Descriptions: Si5367".
 - Changed font of register names to *underlined italics*.
- Updated "3. Ordering Guide" on page 12.
- Added "5. Recommended PCB Layout".
